I. Executive Summary

This report summarizes the results of a traffic impact study conducted by Kenig, Lindgren, O’Hara, Aboona, Inc. (KLOA, Inc.) for a proposed warehouse/distribution building to be located at 10636 S. Woodlawn Avenue in Chicago, Illinois. The objectives of the traffic study are as follows:

- Determine the existing vehicular, pedestrian, bicycle, and public transportation conditions in the study area to establish a base condition.
- Assess the impact that the proposed facility will have on transportation conditions in the area.
- Determine any street, access, bicycle, and pedestrian modifications and/or improvements that will be necessary to effectively accommodate and mitigate future conditions.

Vehicle, pedestrian, and bicycle counts were conducted during the weekday morning and weekday evening peak periods at the intersections of Woodlawn Avenue/Doty Avenue with 103rd Street and multiple existing access drives serving the Pullman Community Center, Amazon facility, Pullman Park, and Gotham Greens in order to determine the general peak hour of traffic activity during these time periods.

As proposed, the site will be developed with an approximately 160,025 square-foot warehouse/distribution building with 20 truck loading bays. Access to the facility will be provided via (1) two proposed access drives on Doty Avenue which will replace the existing Pullman Park north access drive and (2) cross-access with Pullman Park.

Based on the preceding analyses and recommendations, the following conclusions have been made:

- Primary access to the proposed development will be provided via the following two access drives on Doty Avenue and will replace the Pullam Park north access drive:
 - A proposed full-movement access drive located approximately 595 feet north of the Pullman Park main access drive that will provide access to the employee parking and Pullman Park. This access drive will provide one inbound lane and one outbound lane with outbound movements under stop sign control.
 - A proposed full-movement access drive located approximately 900 feet north of the Pullman Park main access drive that will provide access to the loading bays (truck traffic). This access drive will provide one inbound lane and one outbound lane wide enough to accommodate turning truck traffic. Outbound movements should be under stop sign control.

- Consideration should be given to restriping Doty Avenue to provide exclusive left-turn lanes or a two-way, left-turn lane serving the two access drives. Similar to the Woodlawn Avenue/Doty Avenue cross sections further north and south of the subject site, the buffered area between the vehicle lanes and the bike lanes will need to be reduced to accommodate the exclusive left-turn lanes or a two-way, left-turn lane.
- Secondary access to the employee parking for the facility will be provided via cross access with Pullman Park.
- The proposed access system will be adequate in accommodating the traffic estimated to be generated by the facility.
- Area intersections have sufficient reserve capacity to accommodate the traffic estimated to be generated by the proposed facility and no street improvements or traffic control modifications are required.

1. Introduction

This report summarizes the methodologies, results, and findings of a traffic impact study conducted by Kenig, Lindgren, O'Hara, Aboona, Inc. (KLOA, Inc.) for a proposed warehouse/distribution building to be located at 10636 S. Woodlawn Avenue in Chicago, Illinois. The site, which is currently vacant, is located on the west side of Doty Avenue bounded by Pullman Park on the south and Gotham Greens on the north. As proposed, the site will be developed with an approximately 160,025 square-foot warehouse/distribution building with 20 truck loading bays. Access to the facility will be provided via (2) two proposed access drives on Doty Avenue which will replace the existing Pullman Park north access drive and (2) cross-access with Pullman Park.

The purpose of this study was to examine background traffic conditions, assess the impact that the proposed facility will have on traffic conditions in the area, and determine if any street or access improvements are necessary to accommodate the traffic generated by the proposed facility.

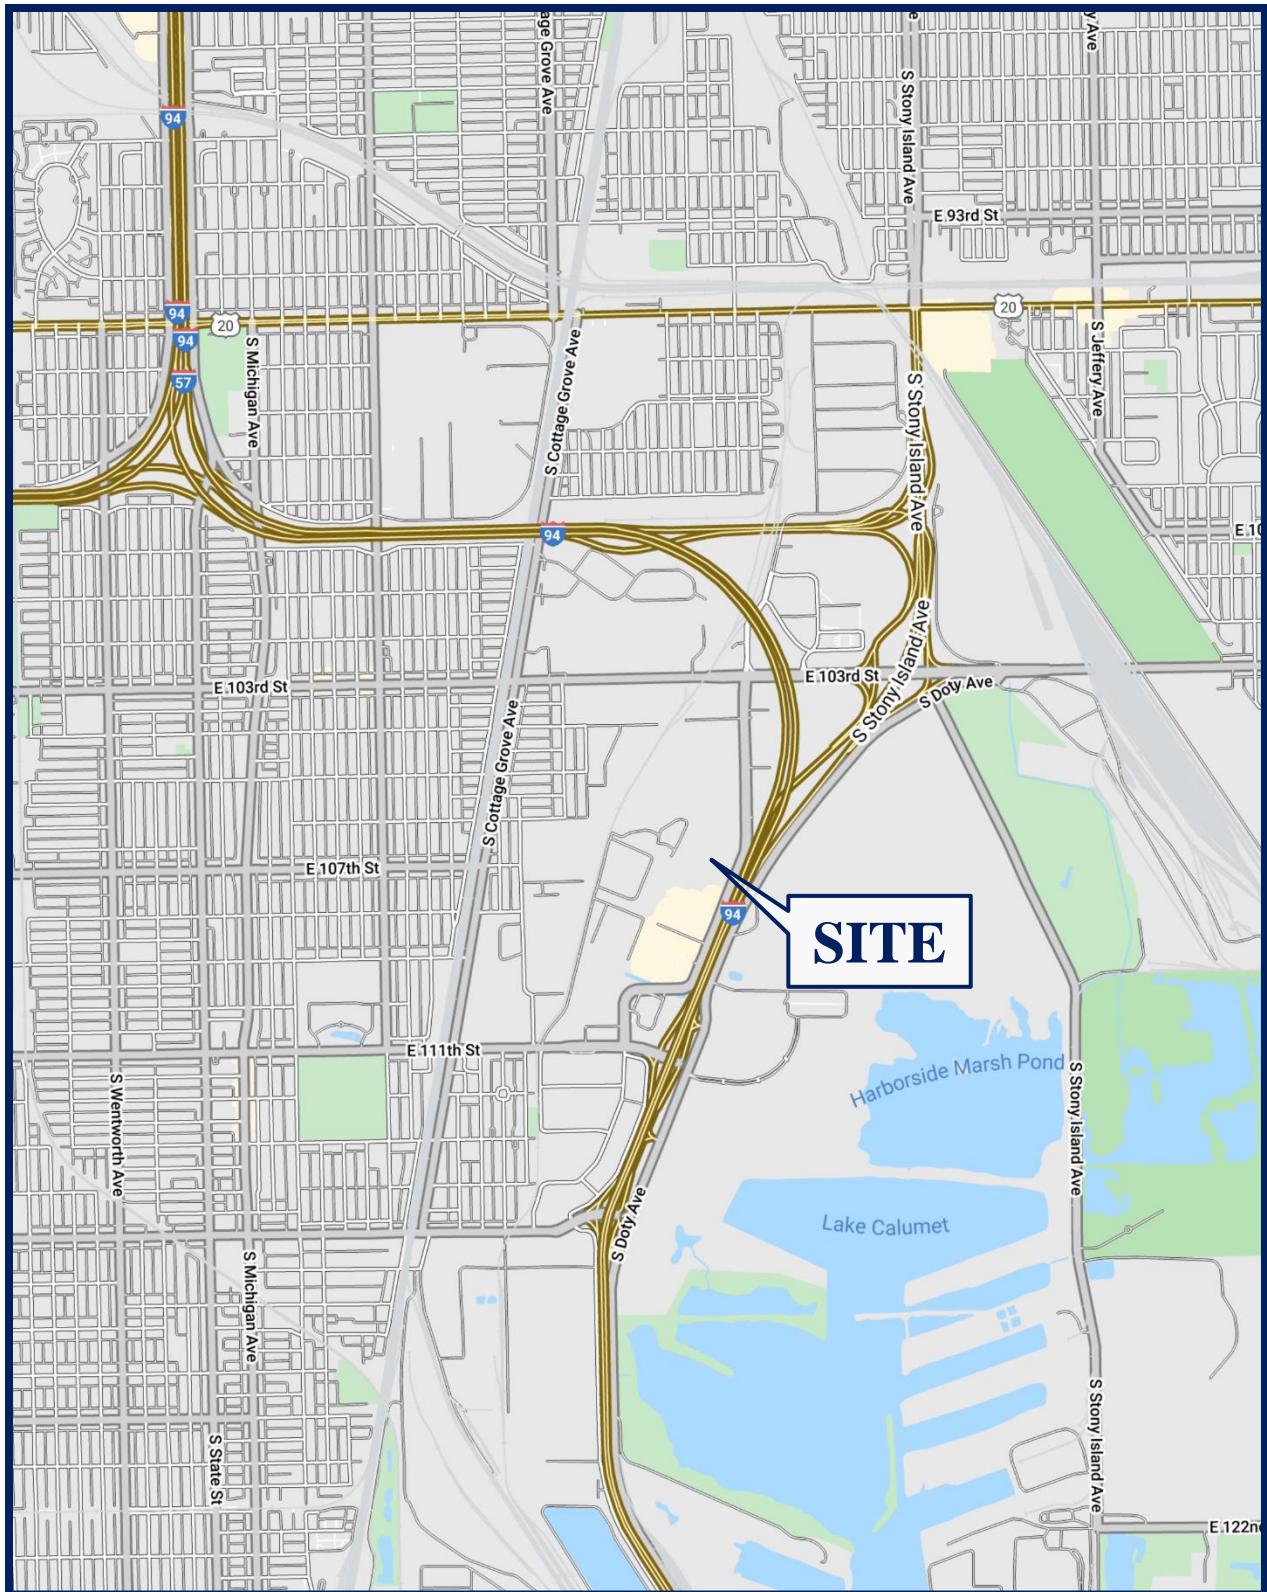

Figure 1 shows the location of the site in relation to the area street system. **Figure 2** shows an aerial view of the site.

The sections of this report present the following:

- Existing street conditions
- A description of the facility
- Directional distribution of the facility traffic
- Vehicle trip generation for the facility
- Future traffic conditions including access to the facility
- Traffic analyses for the weekday morning and weekday evening peak hours
- Recommendations with respect to adequacy of the site access and adjacent street system

Traffic capacity analyses were conducted for the weekday morning and weekday evening peak hours for the following conditions:

1. Existing Traffic Volumes – Analyze the capacity of the existing street system based on existing peak hour traffic volumes in the surrounding area.
2. Year 2029 No-build Conditions – Analyze the capacity of the future street system using the no-build traffic volumes that include the existing traffic volumes, ambient traffic growth, and the traffic estimated to be generated by the proposed 10330 S. Woodlawn warehouse/distribution building to be located north of the site.
3. Year 2029 Projected Conditions – Analyze the capacity of the future street system using the projected traffic volumes that include the no-build traffic volumes and the traffic estimated to be generated by the proposed facility.

Aerial View of Site

Figure 2

10636 S. Woodlawn Avenue
Chicago, Illinois

2. Existing Conditions

Existing transportation conditions in the vicinity of the site were documented based on field visits conducted by KLOA, Inc. in order to obtain a database for projecting future conditions. The following provides a description of the geographical location of the site, physical characteristics of the area street system including lane usage and traffic control devices, and existing peak hour traffic volumes.

Site Location

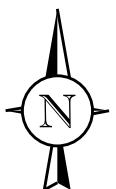

The proposed facility site is bounded by Gotham Greens to the north, Doty Avenue to the east, Pullman Park to the south, and a Whole Foods distribution center to the west. The Pullman Community Center is located on the east side of Woodlawn Avenue north of the site and an Amazon Last Mile Distribution Center (Amazon facility) is located on the west side of Woodlawn Avenue north of the site.

Existing Street System Characteristics

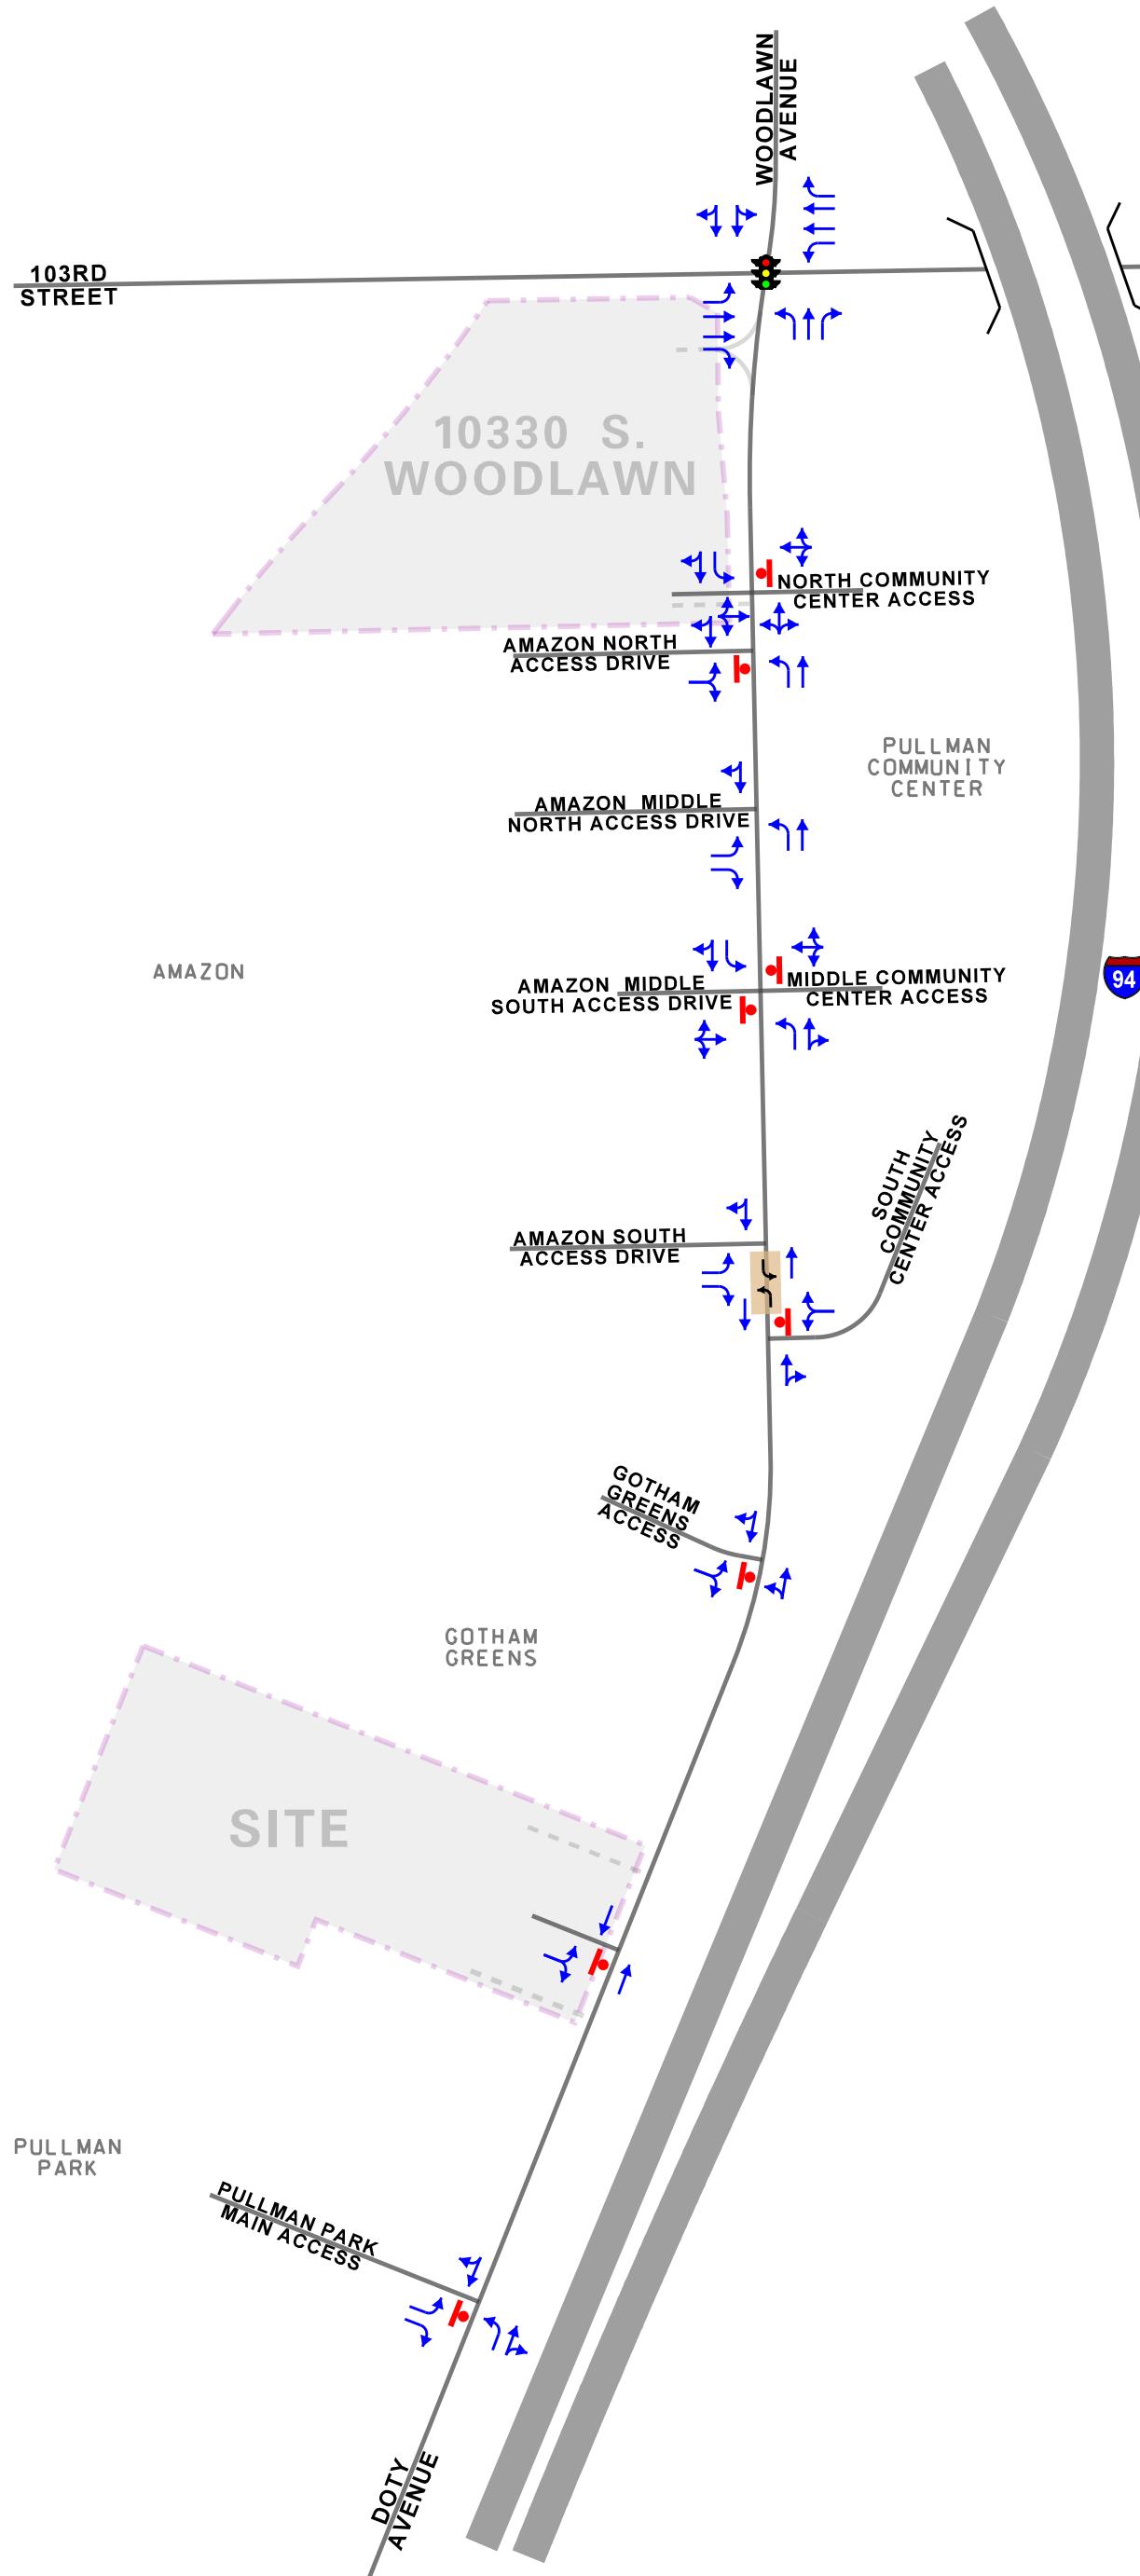

The characteristics of the existing streets near the site are described below and illustrated in **Figure 3**. All streets are under the jurisdiction of the Chicago Department of Transportation (CDOT) unless otherwise noted.

Woodlawn Avenue/Doty Avenue is a north-south major collector street that generally provides a three-lane cross section with one vehicle lane in each direction and a center painted median. Woodlawn Avenue becomes Doty Avenue approximately one-half mile south of 103rd Street. At its signalized intersection with 103rd Street, Woodlawn Avenue provides an exclusive left-turn lane, a through lane, and an exclusive right-turn lane on the northbound approach and an exclusive left-turn lane and a shared through/right-turn lane on the southbound approach. Woodlawn Avenue/Doty Avenue provides left-turn lanes at most access drives south of 103rd Street including the Amazon facility, Pullman Community Center, and Pullman Park between 103rd Street and 111th Street, parking is prohibited on both sides of Woodlawn Avenue/Doty Avenue and a separate bike lane is provided in both directions. Further, a mid-block at-grade pedestrian crossing with pedestrian refuge island is located just north of the Gotham Greens access drive. Woodlawn Avenue/Doty Avenue has a posted speed limit of 30 miles per hour.

103rd Street is an east-west, minor arterial street that has a full interchange with the Bishop Ford Expressway (Interstate 94) east of Woodlawn Avenue via Stoney Island Avenue. It provides two travel lanes in each direction and has an at-grade railroad crossing located west of its signalized intersection with Woodlawn Avenue. East of Woodlawn Avenue, 103rd Street is under the jurisdiction of the Illinois Department of Transportation (IDOT). At its signalized intersection with Woodlawn Avenue, 103rd Street provides an exclusive left-turn lane, two through lanes, and an exclusive right-turn lane on the eastbound approach and an exclusive left-turn lane, two through lanes, and a free-flow right-turn lane on the westbound approach. 103rd Street carries an Annual Average Daily Traffic (AADT) volume of 13,100 to 15,400 vehicles (IDOT 2022) and has a posted speed limit of 35 miles per hour. Parking is restricted on both sides of the street.

NOT TO SCALE

The access drives located along Woodlawn Avenue/Doty Avenue and included in the study area provide one inbound lane and one outbound lane with the outbound lanes generally under stop sign control except the Pullman Park main access drive and two of the Amazon facility access drives. These three access drives provide one inbound lane and two outbound lane striped for an exclusive left-turn lane and an exclusive right-turn lane. The outbound lanes are generally under stop sign control.

Alternative Modes of Transportation

Accessibility to and from the area is enhanced by the various alternative modes of transportation serving the area as summarized below.

Public Transportation The area is served by the south leg of the CTA rapid transit Red Line which extends from the Loop in downtown Chicago to 95th Street on the south. The nearest Red Line station is located at the intersection of 95th Street and the Dan Ryan Expressway, two miles northwest of the site. The Metra Electric commuter rail line has stops at 103rd Street and Cottage Grove Avenue approximately one mile northwest of the site and at 111th Street and Cottage Grove Avenue approximately one mile southwest of the site. In addition, the following bus routes serve the immediate area and have stops near the facility:

- *Route 111A - Pullman Shuttle* primarily runs along 111th Street and Doty Avenue from Pullman Park Plaza on the east to the Pullman/111th Street and Kensington/115th Street Metra stations on the west. Service is provided seven days a week.
- *Route 115 – Pullman/115th* primarily runs along Cottage Grove Avenue from the 95th Street Red Line station on the north to 115th Street and Marshfield Plaza on the south. Service is provided seven days a week.

Pedestrian Facilities Sidewalks and high-visibility crosswalks are generally provided on all of the streets within the study area. Countdown pedestrian signals are provided at the signalized intersection of Woodlawn Avenue with 103rd Street.

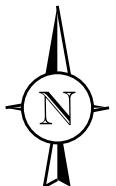

Bicycle Facilities Woodlawn Avenue/Doty Avenue provides bike lanes in both directions. According to the City of Chicago's *Streets for Cycling Plan 2020*, 103rd Street and Cottage Grove Avenue are Crosstown Bike Routes.

Existing Traffic Volumes

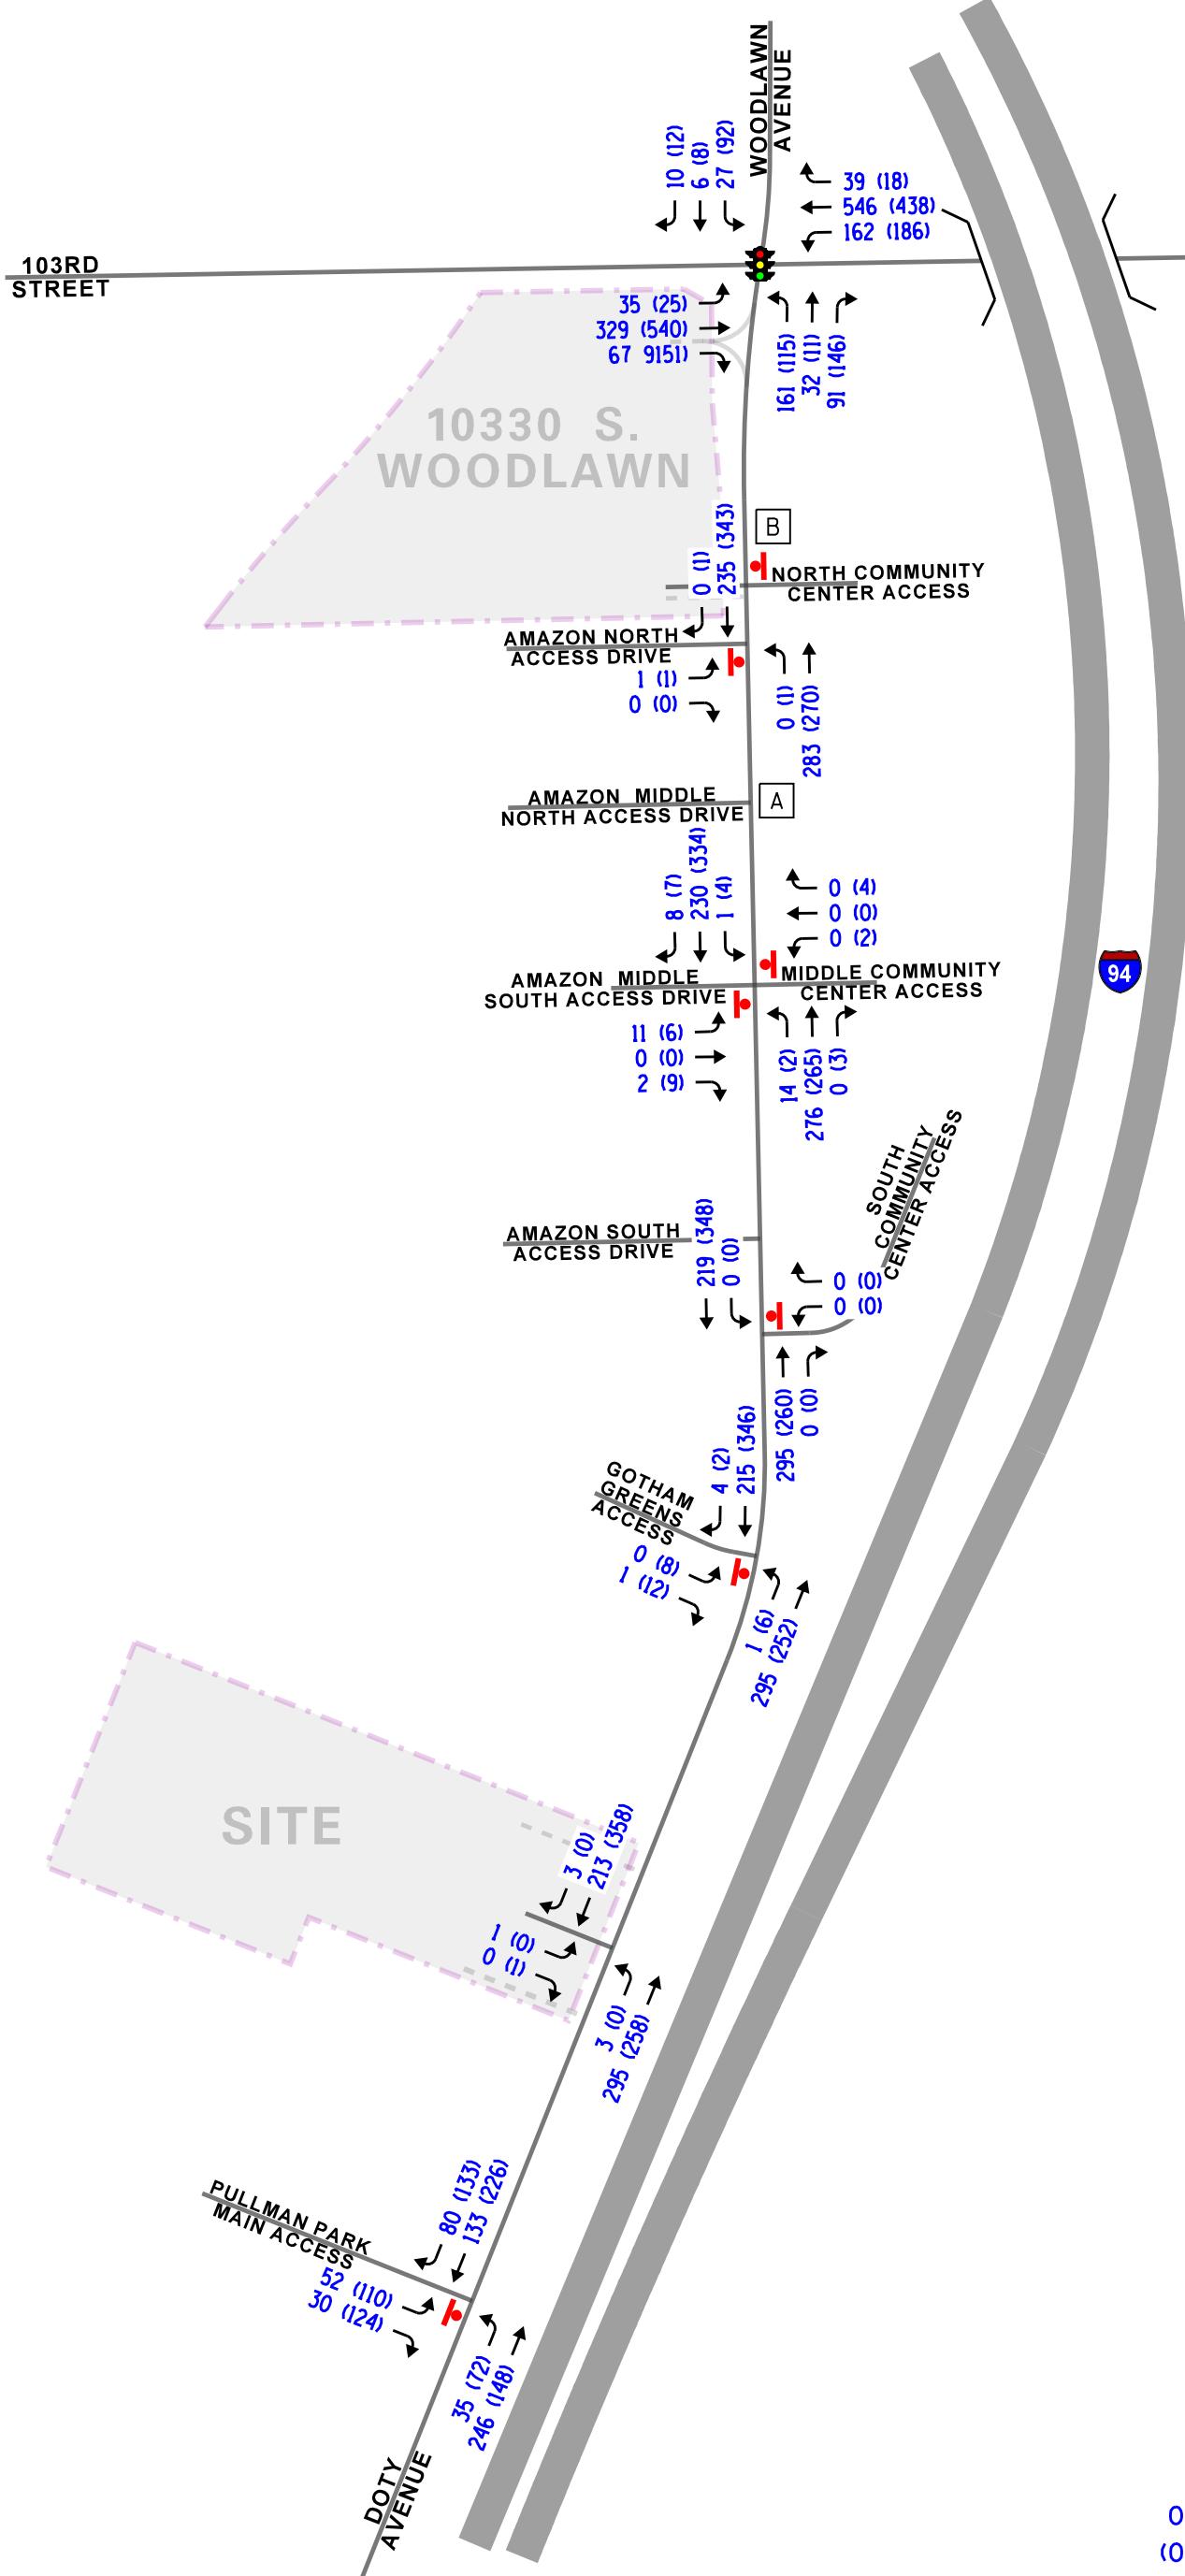

In order to determine current traffic conditions in the vicinity of the site, KLOA, Inc. conducted peak period traffic counts in September, 2023 during the weekday morning (7:00 A.M. to 9:00 A.M.) and weekday evening (4:00 P.M. to 6:00 P.M.) peak periods at the following intersections:

- Woodlawn Avenue with 103rd Street
- Woodlawn Avenue with the Amazon access drives
- Woodlawn Avenue with the Pullman Community Center access drives
- Woodlawn Avenue with the Gotham Greens access drive
- Doty Avenue with the Pullman Park north and main access drives

The results of the traffic counts indicated that the weekday morning peak hour of traffic occurs from 7:45 A.M. to 8:45 A.M. and the weekday evening peak hour of traffic occurs from 4:00 P.M. to 5:00 P.M. **Figure 4** illustrates the existing peak hour vehicle traffic volumes, inclusive of heavy vehicles. **Figure 5** illustrates the existing heavy vehicle peak hour traffic volumes. **Figure 6** illustrates the existing pedestrian and bicycle volumes, showing direction of travel.

3. Traffic Characteristics of the Proposed Facility

In order to properly evaluate future traffic conditions in the surrounding area, it was necessary to determine the traffic characteristics of the proposed facility, including the directional distribution and volumes of traffic that it will generate.

Proposed Facility Plan

As proposed, the site will be developed with a 160,025 square-foot warehouse/distribution building with 20 truck loading bays. In addition, the facility will provide 204 parking spaces for employees on the south and east sides of the building. Primary access to the facility is to be provided via (1) two access drives on Doty Avenue, which will replace the existing Pullman Park north access drive, and (2) cross access with Pullman Park as summarized below:

- A proposed full-movement access drive on Doty Avenue located approximately 595 feet north of the Pullman Park main access drive that will provide access to the employee parking and Pullman Park. This access drive will provide one inbound lane and one outbound lane with outbound movements under stop sign control.
- A proposed full-movement access drive on Doty Avenue located approximately 900 feet north of the Pullman Park main access drive that will primarily serve the loading bays of the facility (truck traffic). This access drive will provide one inbound lane and one outbound wide enough to accommodate turning truck traffic. Outbound movements should be under stop sign control.

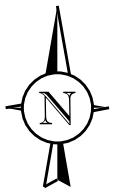

Consideration should be given to restriping Doty Avenue to provide exclusive left-turn lanes or a two-way, left-turn lane serving the two access drives. Similar to the Woodlawn Avenue/Doty Avenue cross sections further north and south of the subject site, the buffered area between the vehicle lanes and the bike lanes will need to be reduced to accommodate the exclusive left-turn lanes or a two-way, left-turn lane.

Secondary access to the employee parking for the facility will be provided via cross access with Pullman Park.

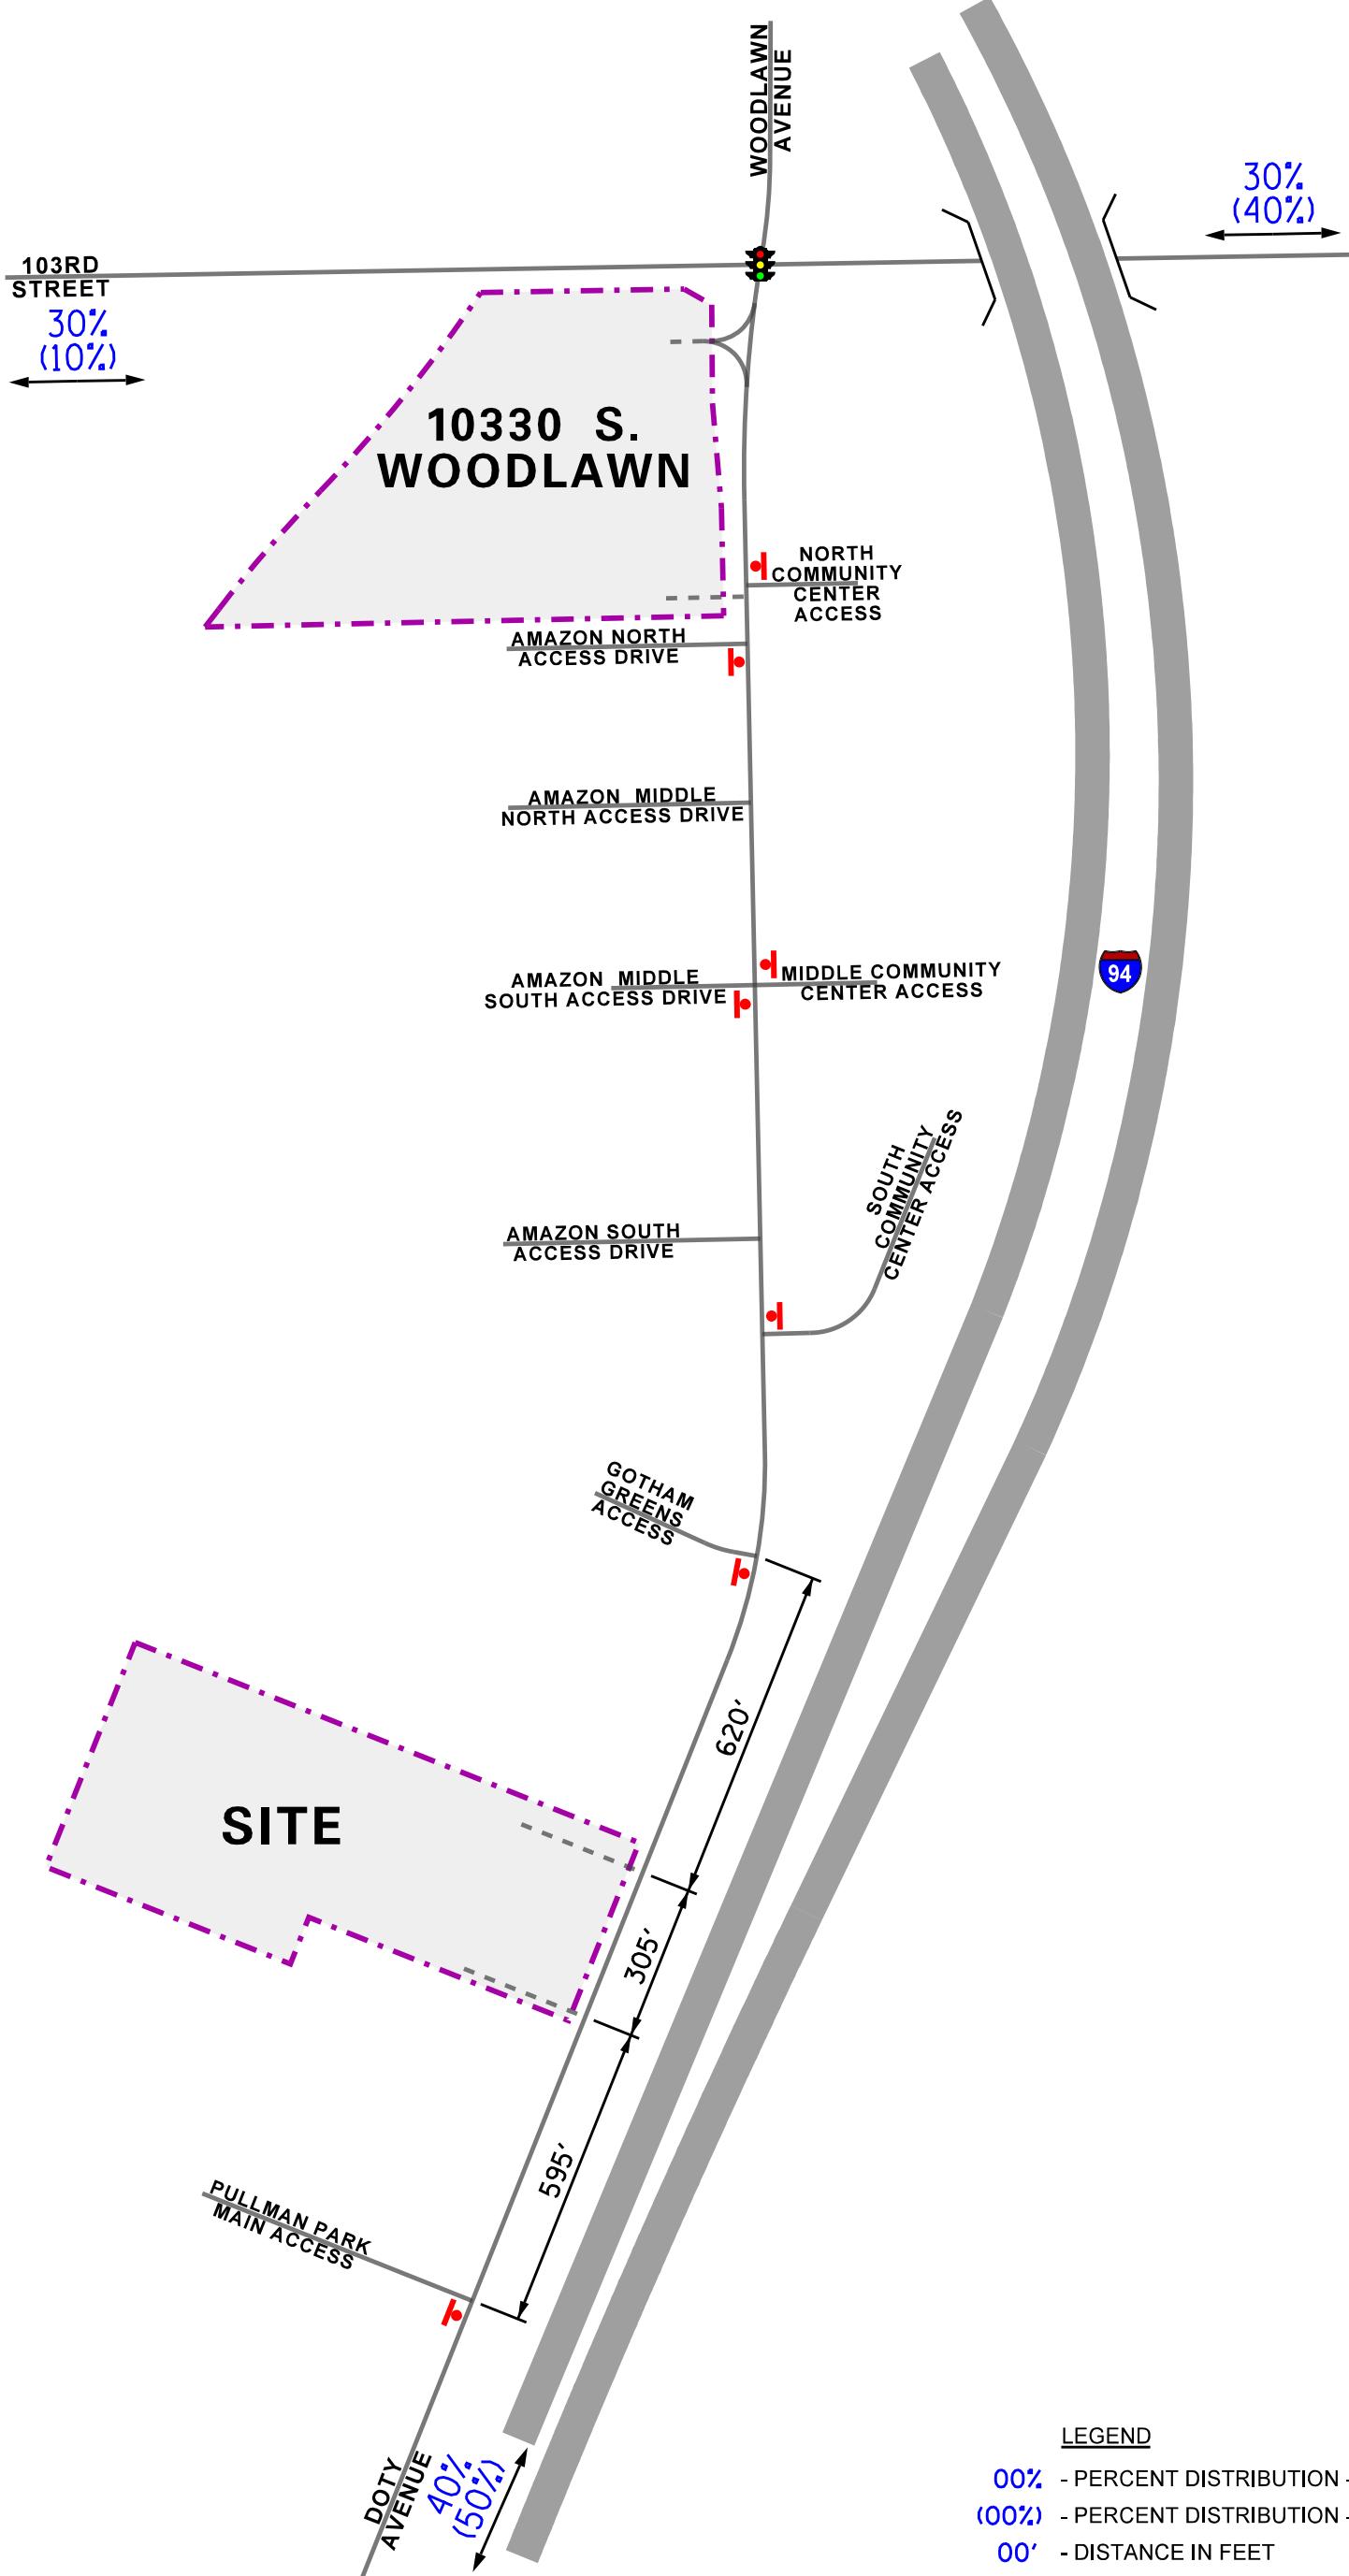

A copy of the preliminary site plan is included in the Appendix.

Directional Distribution

The directions from which traffic will approach and depart the site was estimated based on existing travel patterns, as determined from the traffic counts, the operation of the existing street system and the proposed facility access system, and previous studies conducted in the area. **Figure 7** illustrates the directional distribution of traffic.

NOT TO SCALE

Facility-Generated Traffic Volumes

The total number of employee and truck trips estimated to be generated by the proposed facility was based on the Warehousing (Land-Use Code 150) vehicle trip generation rates contained in *Trip Generation Manual*, 11th Edition, published by the Institute of Transportation Engineers (ITE). Copies of the ITE trip generation rates are included in the Appendix.

Table 1 summarizes the trips projected to be generated by the facility during the peak hours and on a daily basis. **Table 2** summarizes the trips projected to be generated by the facility throughout the day.

Table 1

ESTIMATED PEAK HOUR AND DAILY TRIP GENERATION

Based on daily trips (Table 1) and ITE's Hourly Distribution of Entering and Exiting Truck Trips and Vehicle Trips tables.

4. Projected Traffic Conditions

The total projected traffic volumes include the existing traffic volumes, increase in background traffic due to growth, and the traffic estimated to be generated by the proposed facility.

Facility Traffic Assignment

The estimated weekday morning and weekday evening peak hour traffic volumes that will be generated by the proposed facility were assigned to the street system in accordance with the previously described directional distribution (Figure 7). **Figure 8** illustrates the traffic assignment of the new passenger vehicle trips and **Figure 9** illustrates the traffic assignment of the new truck trips for the facility. It should be noted that no facility traffic was assigned to the other Pullman Park access drives in order to provide a conservative (worst case) analysis at the proposed driveways.

No-Build Traffic Volumes

To account for any additional increase in traffic due to other factors or developments not previously discussed, an ambient growth factor of 0.5 percent per year was also applied to the study area over a six-year period to represent Year 2029 conditions. In order to account for the increase in population in the study area, bicycle and pedestrian volumes were increased by 10 percent at each intersection.

In addition, the traffic that will be generated by a proposed warehouse/distribution building to be located in the southwest quadrant of the 103rd Street/Woodlawn Avenue intersection (10330 S. Woodlawn Avenue) was included in the Year 2029 no-build traffic volumes. The volume of traffic that will be generated by the proposed 169,520 square-foot warehouse/distribution building was based on the KLOA, Inc. traffic impact study performed for the facility.

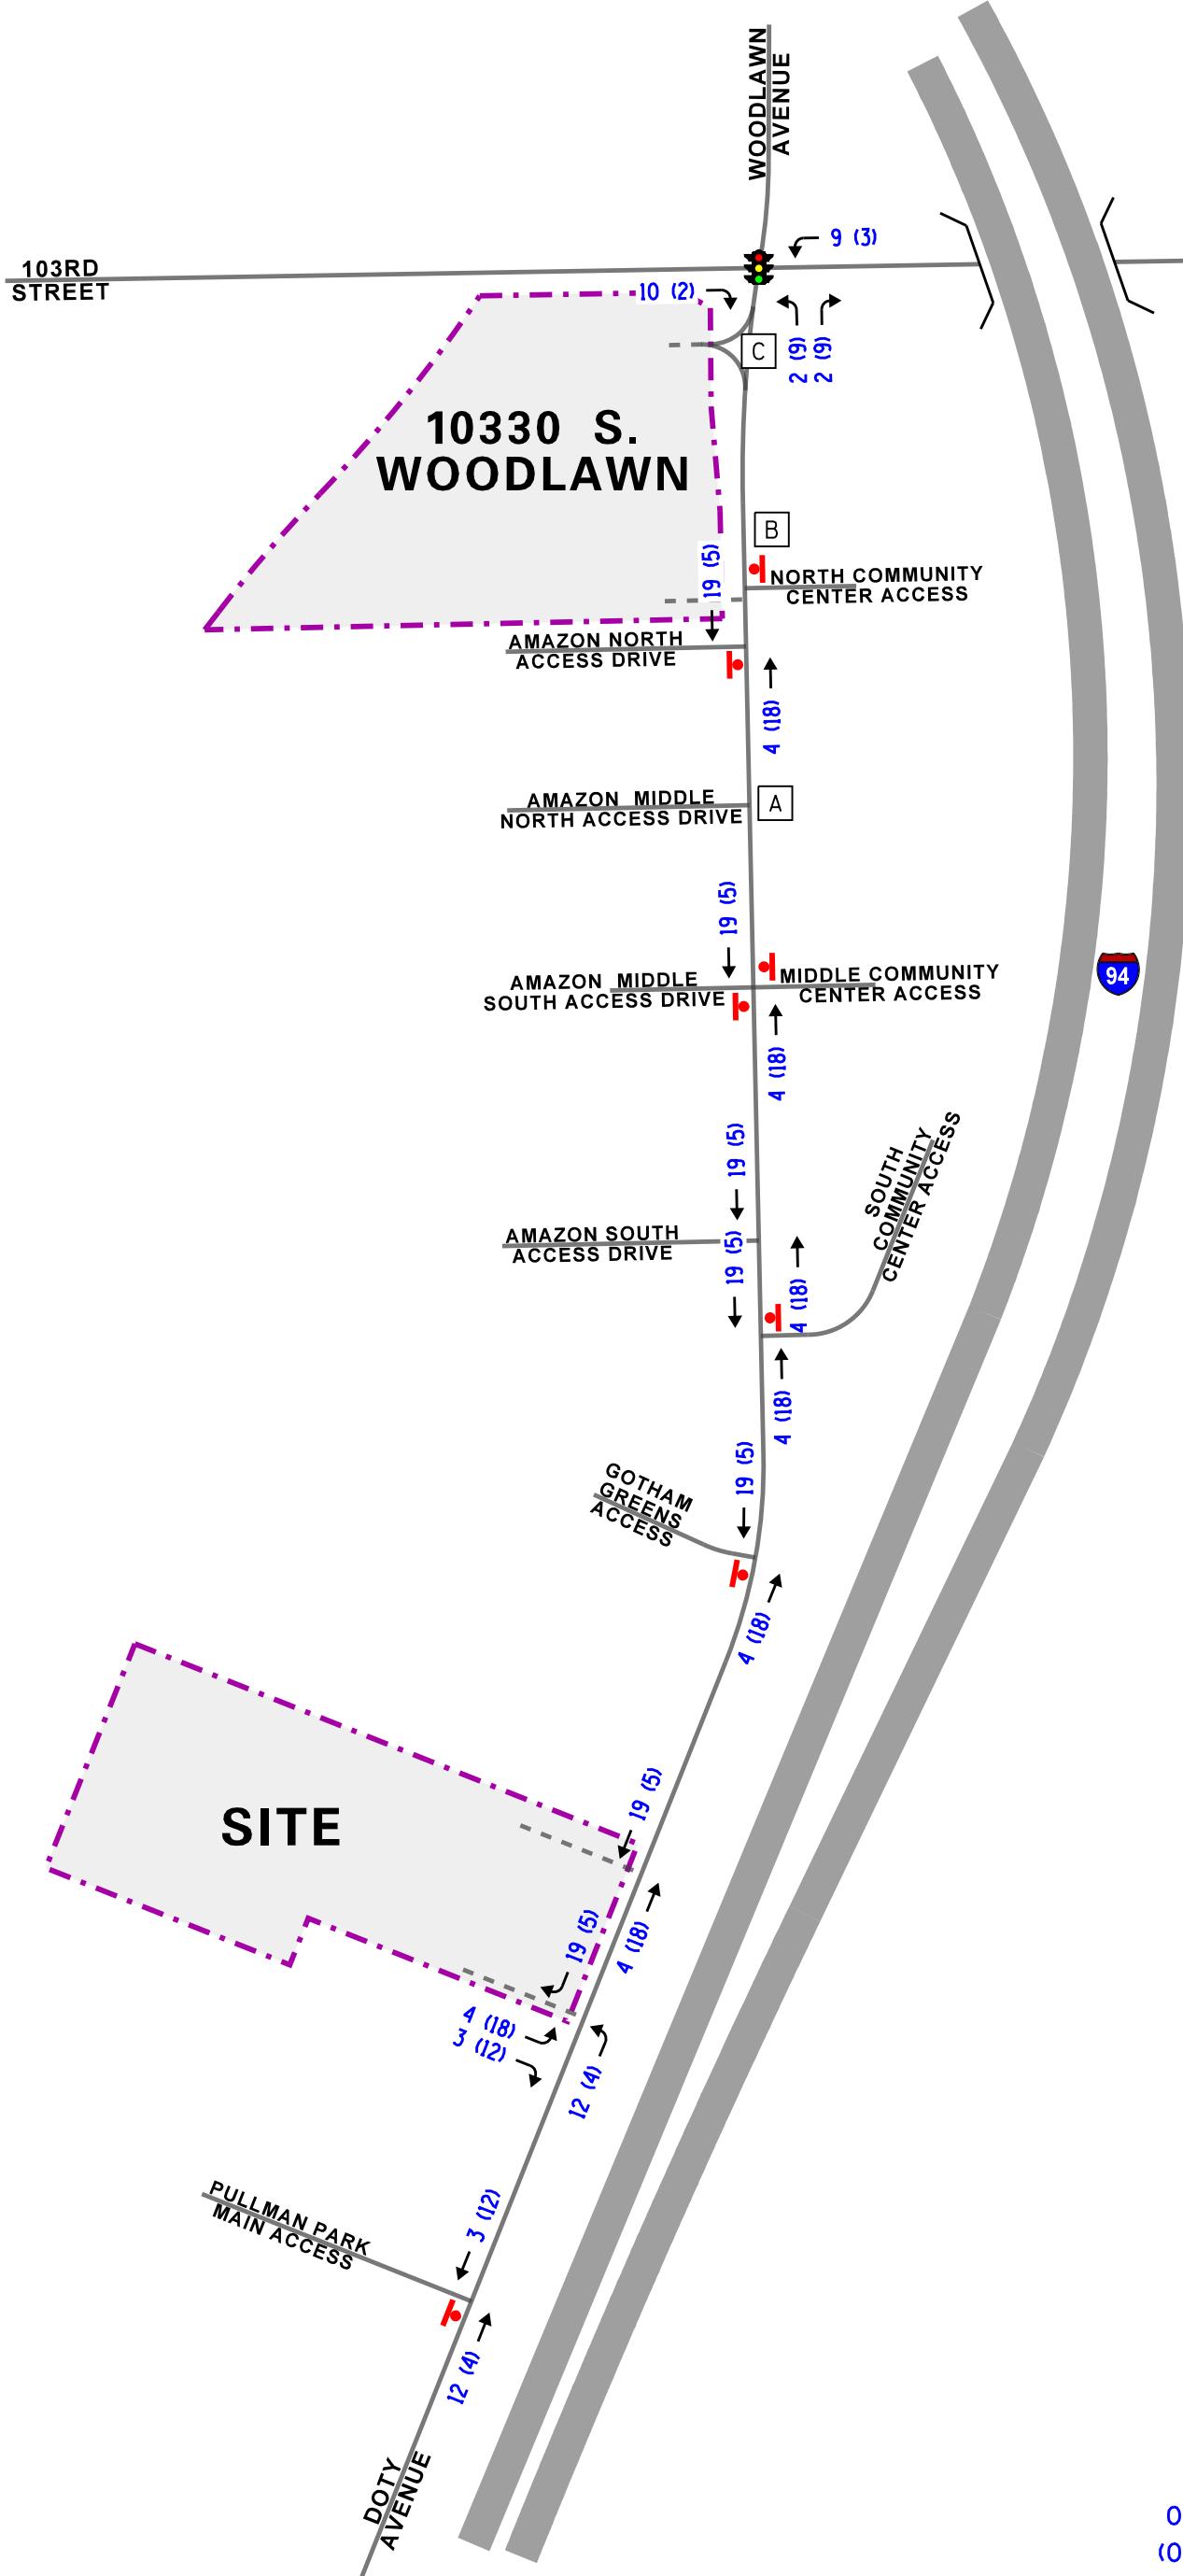

Figure 10 illustrates the Year 2029 no-build volumes which include the existing traffic volumes increased by the ambient growth factor and the traffic projected to be generated by the 10330 S. Woodlawn Avenue facility.

Total Projected Traffic Volumes

The Year 2029 no-build traffic volumes were combined with the new peak hour traffic volumes generated by the proposed facility to determine the Year 2029 total traffic volumes, shown in **Figure 11**.

5. Traffic Analysis and Recommendations

The following provides an evaluation conducted for the weekday morning and weekday evening peak hours. The analysis includes conducting capacity analyses to determine how well the street system and access drives are projected to operate and whether any street improvements or modifications are required.

Traffic Analyses

Intersection analyses were performed for the weekday morning and weekday evening peak hours for the existing, Year 2029 no-build, and Year 2029 total projected traffic volumes.

The traffic analyses were performed using the methodologies outlined in the Transportation Research Board's *Highway Capacity Manual (HCM), 6th Edition* and analyzed using Synchro/SimTraffic 11 software. The analysis for the signalized intersections were conducted utilizing actual cycle lengths, phasings, and offsets.

The analyses for the unsignalized intersections determine the average control delay to vehicles at an intersection. Control delay is the elapsed time from a vehicle joining the queue at a stop sign (includes the time required to decelerate to a stop) until its departure from the stop sign and resumption of free flow speed. The methodology analyzes each intersection approach controlled by a stop sign and considers traffic volumes on all approaches and lane characteristics.

The ability of an intersection to accommodate traffic flow is expressed in terms of level of service, which is assigned a letter from A to F based on the average control delay experienced by vehicles passing through the intersection. The *Highway Capacity Manual* definitions for levels of service and the corresponding control delay for signalized intersections and unsignalized intersections are included in the Appendix of this report.

Summaries of the traffic analysis results showing the level of service and overall intersection delay (measured in seconds) for the existing, Year 2029 no-build, and Year 2029 total projected conditions are presented in **Tables 3** through **6**. A discussion of the intersections follows. Summary sheets for the capacity analyses are included in the Appendix.

LOS = Level of Service				
Delay is measured in seconds.				

Discussion and Recommendations

The following summarizes how the intersections are projected to operate and identifies any street and traffic control improvements necessary to accommodate the facility-generated traffic.

Woodlawn Avenue with 103rd Street

The results of the capacity analysis indicates that this intersection currently operates at an overall Level of Service (LOS) B during the weekday morning and weekday evening peak hours. Further, all Woodlawn Avenue movements currently operate at LOS D or better during both peak hours and all 103rd Street movements operate at LOS B or better during both peak hours.

Under Year 2029 no-build conditions, this intersection is projected to continue to operate at B during both peak hours. Further, all Woodlawn Avenue movements are projected to continue to operate at LOS D or better during both peak hours with the exception of the northbound left-turn movement, which is projected to operate at LOS E during the weekday morning peak hour. All 103rd Street movements are projected to continue to operate at LOS B or better during both peak hours.

Under Year 2029 total projected volumes, the intersection is expected to continue to operate at LOS B during both peak hours. Further, all movements are projected to continue to operate at the same level of service as no-build conditions. It should be noted that all movements, including the northbound left turn, are projected to operate with volume to capacity ratios of less than 1.0 and 95th percentile queues that can be accommodated within the existing turn lanes.

As such, this intersection has sufficient reserve capacity to accommodate the projected facility-generated traffic volumes and no street improvements and/or traffic control modifications are required at this intersection.

Woodlawn Avenue/Doty Avenue with the Existing Area Access Drives (Pullman Community Center, Amazon Facility, Pullman Park, Gotham Greens, and Proposed 10330 S. Woodlawn Facility)

The results of the capacity analyses indicate that the turning movements to and from the area access drives currently operate at LOS C or better during the weekday morning and weekday evening peak hours.

Under Year 2029 no-build conditions, the turning movements to and from the area access drives are projected to continue to operate at LOS C or better during the weekday morning and evening peak hours.

Under Year 2029 total projected conditions, the turning movements to and from the area access drives are projected to continue to operate at LOS C or better during the weekday morning and evening peak hours. As such, intersections of Woodlawn Avenue/Doty Avenue with the area access drives have sufficient reserve capacity to accommodate the traffic to be generated by the proposed facility and no street improvements and/or traffic control modifications are required.

Doty Avenue with the North Pullman Park Access Drive/South Site Access Drive

The results of the capacity analyses indicate that turning movements to and from the north Community Center access drive currently operate at LOS B or better during the weekday morning and weekday evening peak hours.

As proposed, the existing north Pullman Park access drive will be removed and a proposed full-movement access drive will be provided on Doty Avenue approximately 595 feet north of the Pullman Park main access drive and will provide access to the employees and Pullman Park. The new access drive will provide one inbound lane and one outbound lane with outbound movements under stop sign control.

Under Year 2029 total projected conditions, outbound movements from the access drive are projected to operate at LOS B during both peak hours. Further, the northbound left-turn movement is projected to operate at LOS A with 95th percentile queues of one to two vehicles. As such, the proposed access drive will adequately accommodate the projected facility traffic volumes. and will provide efficient access.

Doty Avenue with the North Site Access Drive

As proposed, a full-movement access drive will be provided on Doty Avenue located approximately 900 feet north of the Pullman Park main access drive that will primarily serve the facility loading bays (truck traffic). This access drive will provide one inbound lane and one outbound lane wide enough to accommodate turning truck traffic. Outbound movements should be under stop sign control.

Under Year 2029 total projected conditions, outbound movements from the access drive are projected to operate at LOS B during both peak hours. Further, the northbound left-turn movement is projected to operate at LOS A with 95th percentile queues of one to two vehicles. As such, the proposed access drive will provide orderly and efficient access to the facility with limited impact on Doty Avenue.

Consideration should be given to restriping Doty Avenue to provide exclusive left-turn lanes or a two-way, left-turn lane serving the two access drives. Similar to the Woodlawn Avenue/Doty Avenue cross sections further north and south of the subject site, the buffered area between the vehicle lanes and the bike lanes will need to be reduced to accommodate the exclusive left-turn lanes or a two-way, left-turn lane.

6. Conclusion

Based on the preceding analyses and recommendations, the following conclusions have been made:

- As proposed, the site will be developed with an approximately 160,025 square-foot warehouse/distribution building.
- Primary access to the proposed development will be provided via the following two access drives on Doty Avenue and will replace the Pullam Park north access drive:
 - A proposed full-movement access drive located approximately 595 feet north of the Pullman Park main access drive that will provide access to the employee parking and Pullman Park. This access drive will provide one inbound lane and one outbound lane with outbound movements under stop sign control.
 - A proposed full-movement access drive located approximately 900 feet north of the Pullman Park main access drive that will provide access to the loading bays (truck traffic). This access drive will provide one inbound lane and one outbound wide enough to accommodate turning truck traffic. Outbound movements should be under stop sign control.
- Consideration should be given to restriping Doty Avenue to provide exclusive left-turn lanes or a two-way, left-turn lane serving the two access drives. Similar to the Woodlawn Avenue/Doty Avenue cross sections further north and south of the subject site, the buffered area between the vehicle lanes and the bike lanes will need to be reduced to accommodate the exclusive left-turn lanes or a two-way, left-turn lane.
- Secondary access to the employee parking for the facility will be provided via cross access with Pullman Park.
- The proposed access system will be adequate in accommodating the traffic estimated to be generated by the facility.
- Area intersections have sufficient reserve capacity to accommodate the traffic estimated to be generated by the proposed facility and no street improvements or traffic control modifications are required.

1 OF 1

Level of Service Criteria

LEVEL OF SERVICE CRITERIA

Signalized Intersections		
Level of Service	Interpretation	Average Control Delay (seconds per vehicle)
A	Favorable progression. Most vehicles arrive during the green indication and travel through the intersection without stopping.	≤ 10
B	Good progression, with more vehicles stopping than for Level of Service A.	$>10 - 20$
C	Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear. Number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.	$>20 - 35$
D	The volume-to-capacity ratio is high and either progression is ineffective or the cycle length is too long. Many vehicles stop and individual cycle failures are noticeable.	$>35 - 55$
E	Progression is unfavorable. The volume-to-capacity ratio is high and the cycle length is long. Individual cycle failures are frequent.	$>55 - 80$
F	The volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.	>80.0
Unsignalized Intersections		
Level of Service	Average Total Delay (SEC/VEH)	
A	$0 - 10$	
B	$> 10 - 15$	
C	$> 15 - 25$	
D	$> 25 - 35$	
E	$> 35 - 50$	
F	> 50

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.75

Intersection Signal Delay: 14.6

Intersection LOS: B

Intersection Capacity Utilization 58.7%

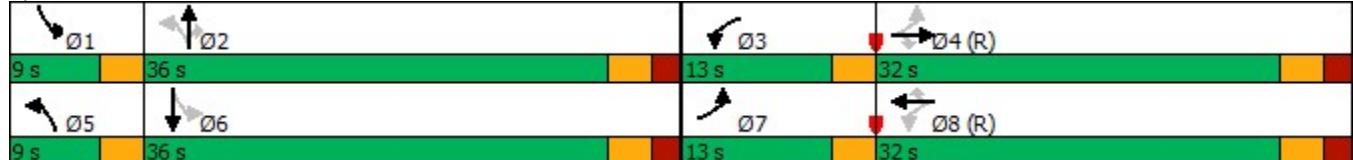

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.58

Intersection Signal Delay: 13.4

Intersection LOS: B

Intersection Capacity Utilization 57.5%

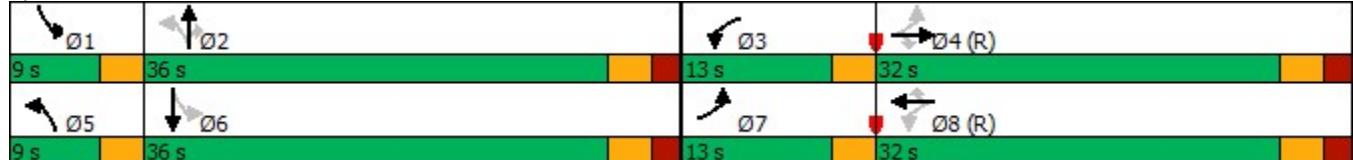

ICU Level of Service B

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.79

Intersection Signal Delay: 15.2

Intersection LOS: B

Intersection Capacity Utilization 60.3%

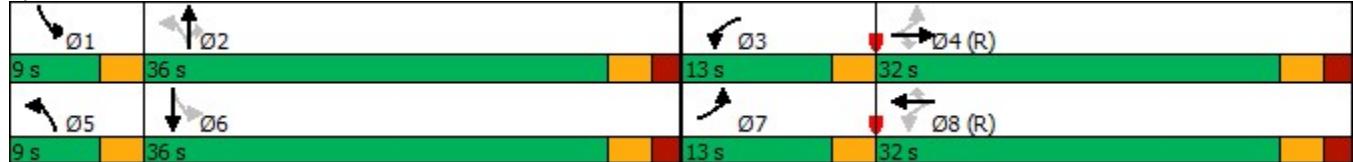

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 13.9

Intersection LOS: B

Intersection Capacity Utilization 59.0%

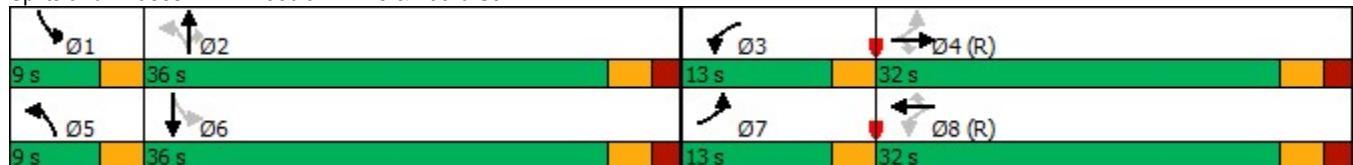

ICU Level of Service B

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 15.2

Intersection LOS: B

Intersection Capacity Utilization 60.9%

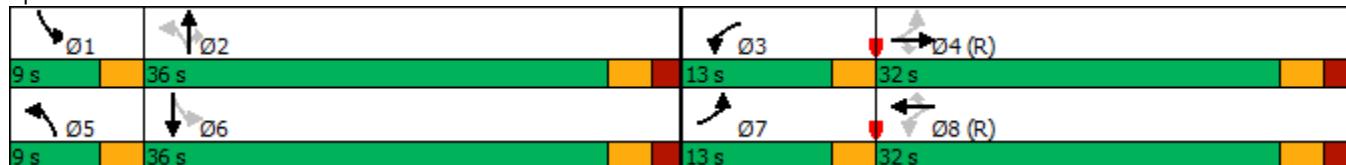

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.61

Intersection Signal Delay: 14.2

Intersection LOS: B

Intersection Capacity Utilization 59.8%

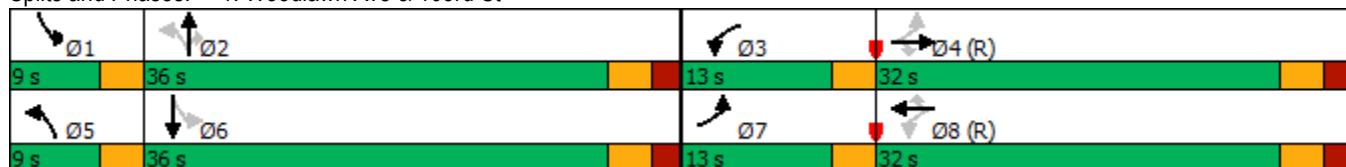

ICU Level of Service B

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Woodlawn Ave & 103rd St
